

HEALTHCARE STAFFING · CREDENTIALING & ONBOARDING

How the client firm made clinician onboarding a competitive advantage with AI agents

One of the largest employee-owned staffing firms in the U.S. was carrying a heavy manual credentialing load. By putting the company's AI agents to work inside the systems and workflows its team already trusted, the client firm cleared the path from placed to ready to work, and kept full human control at every step.

THE CHALLENGE

A trusted firm, held back by its own paperwork

Since 1984, the client firm has built its reputation on one thing: connecting top talent with forward-thinking organizations and making sure every placement is the right fit. But in healthcare staffing, a signed offer is only the starting line. Before a clinician can work a single shift, they have to be credentialed. Documents get collected, requirements verified, exclusions checked, and forms completed across a maze of client and third-party systems. For the firm's team, that meant highly skilled people spending their days chasing paperwork instead of building relationships. Each new account brought its own rulebook, every requirement had to be read and interpreted by hand, and the slow, manual nature of the work created exactly the kind of delays that cost placements and frustrate great candidates. The team knew the process needed to change. The real question was how to change it without losing the human judgment their business depends on.

THE TURNING POINT

A guide that worked inside their world, not around it

Rather than rip out the systems and workflows that the firm's team already trusted, the company embedded its AI agents directly into them, operating under the team's own names, inside the tools they use every day. That single decision shaped everything that followed. **Because the agents worked the way the team already worked, adoption wasn't a fight. It was a relief.** the company set a collaborative rhythm from day one: twice-weekly touch points, an executive summary of progress from one week to the next, and development phases designed together rather than handed down. Every agent action stayed auditable, and the firm's people kept final approval on every decision. As the firm's leadership put it, the team could finally step back from the manual burden and lean into what actually wins in staffing, which is human relationships.

“

In just 90 days, the the company team understood our struggle to improve our healthcare onboarding process and worked quickly and diligently to provide solutions. With a collaborative

approach, we've enhanced both the speed and quality of credential collection while lessening the manual burden on our team.

THE APPROACH

A leveled rollout, one proof point at a time

the firm and the company took a deliberate, leveled approach, building the AI into the business process in stages, with each stage earning trust for the next. the company's agents run the full arc of credentialing readiness across four coordinated stages, and the firm adopted them the same way.

PROVIDER PLACED

READY TO WORK

Define

Reads each assignment and client-specific requirement, and reuses documents already submitted.

Verify

Collects and verifies provider documentation, and runs primary-source and exclusion checks.

Execute

Completes forms across third-party systems, coordinates screenings, and chases missing items.

Deliver

Produces submission-ready packets and maintains readiness through renewals and automated monthly compliance checks.

1

34,705 independent AI actions since go-live, spanning verification, screening, credentialing decisions, and the document-level steps that support them. The system is now running 500+ actions per day and climbing.

2

1,570 credentialing requirements independently reviewed and verified by AI, helping the firm move high-volume onboarding work forward without adding equivalent manual effort.

3

112 candidate onboarding cases have had AI-driven verification applied, with an average of 300+ AI actions taken per candidate onboarded.

4

1,480 automated monthly compliance checks across 83 candidates, including OIG, GSA/SAM exclusion, sex offender registry, and OMIG checks, with recurring screening designed to keep rosters continuously audit-ready.

5

56% of AI verification work happens outside standard business hours, keeping nights and weekends productive even when no credentialer is on shift.

THE RESULTS

From manual burden to measurable momentum

The transformation is already visible in the numbers and in the workday. Since go-live, the company's AI has taken **34,705 independent actions** for the client firm, including verification, screening, and credentialing work, with activity now exceeding 500 actions per day. It has independently reviewed and verified **1,570 credentialing requirements**, applied AI-driven verification across **112 candidate onboarding cases**, and completed **1,480 automated compliance screenings across 83 candidates**, with **monthly compliance checks** continuing across the active roster. More than half of the AI verification work, **56%**, happens outside standard business hours. **Just as important as the volume is where the team's time went instead.** Freed from repetitive document work, the firm's recruiters and credentialers can spend more of their day building relationships with prospective consultants and bringing a more human touch to the onboarding lifecycle.

Agents do the work

A customizable system of AI agents runs onboarding, credentialing, and compliance inside the tools you already use.

Humans keep final approval

Agents surface only exceptions and final decisions. Your team signs off, and every action is fully auditable.

Continuous screening

Automated monthly exclusion and sanction checks keep your roster audit-ready year round across OIG LEIE, SAM.gov, and state Medicaid.

“

By adding the company into our existing workflow, our team has been able to focus on building relationships with our consultants and providing a more human touch to the onboarding lifecycle.

WHY IT MATTERS FOR YOU

The same playbook is open to your organization

The client firm's story isn't unique to large IT-and-healthcare staffing firms. It's the story of anyone who has to credential clinicians before they can work. Whether you run a staffing agency, an ambulatory surgery center, a home health company, or an urgent care network, the bottleneck is the same: too much manual verification, too little time, and a compliance burden that never sleeps. the company was built for exactly that world, running onboarding, credentialing, and continuous screening inside the tools you already use, and keeping your roster audit-ready while your people keep final approval. Customers are seeing roughly 70% faster time-to-start for clinicians and far fewer delays from incomplete or slow verification. The firms that move first won't just be faster. They'll help shape the product as design and pilot partners. The client firm took that step as a strategic partner, and the invitation to help shape what comes next is open now.

34,705 AI actions. 1,570 credentialing requirements reviewed and verified. 56% of verification work happening after hours.

That's what happened when the client firm, one of the largest employee-owned staffing firms in the U.S., put the company's AI agents to work on healthcare credentialing.

The hard part of staffing clinicians isn't the offer. It's everything after: documents

collected, requirements verified, exclusions checked, and forms completed across a maze of third-party systems. It's slow, manual, and it costs placements.

So the company embedded its agents inside the tools the firm's team already used, under their own names, every action auditable, humans keeping final approval. Since go-live, those agents have taken 34,705 actions, independently reviewed and verified 1,570 credentialing requirements, and completed 1,480 compliance screenings across 83 candidates.

The result their CTO cared about most? His team stopped chasing paperwork and went back to building relationships with candidates.

If you credential clinicians, whether a staffing agency, ASC, home health, or urgent care, this playbook is open to you too.

A signed offer is only the starting line in healthcare staffing.

Before a clinician works a single shift, someone has to collect the documents, verify the requirements, run the exclusion checks, and complete forms across a dozen third-party systems. At the client firm, an employee-owned staffing firm operating since 1984, that meant skilled people spending their days on paperwork instead of people.

They wanted to fix it without losing the human judgment their business runs on.

Enter the company. Instead of replacing the firm's systems, its AI agents worked inside them, under the team's own names, every action auditable, every decision still theirs to approve. Since go-live: 34,705 AI actions, 1,570 credentialing requirements reviewed and verified, and 56% of AI verification work completed outside standard business hours.

The payoff wasn't just speed. It was that the firm's recruiters got their time back, and spent it on the human touch that machines can't replace.

6h ·

How do you make healthcare onboarding faster without losing the human touch?

the client firm is answering it with the company:

- 34,705 AI actions since go-live
- 1,570 credentialing requirements reviewed and verified
- 112 candidate onboarding cases with AI-driven verification

- 1,480 automated compliance screenings across 83 candidates
- 56% of AI verification work completed outside business hours
- Agents working inside their existing tools, humans keeping final approval

The best part, per their CTO: the team stopped chasing paperwork and went back to building relationships with candidates.

If your organization credentials clinicians, the same playbook is open to you.
