

Messaging and Positioning Framework

Written by Monica Vendituoli as a demonstration piece

Everything below is invented. Wayfinder and Junction Cloud are fictional. I write messaging and positioning frameworks for AI products in my day job, but those documents belong to my employer and are not mine to publish. So this one is built from scratch, in the same structure I work in, for a product that does not exist. The craft is the point, not the product.

JUNCTION CLOUD, WAYFINDER, MESSAGING AND POSITIONING FRAMEWORK, v1

The product, in one line

Wayfinder is an AI routing agent for inbound sales enquiries. It reads each enquiry, decides which seller should own it, and explains the decision.

Positioning statement Internal use only. Not for customer materials.	For revenue operations leaders at global companies who lose qualified demand in the gap between a form submission and a seller's inbox, Wayfinder is an AI routing agent that reads every inbound enquiry and assigns it to the right seller by territory, language, product line and current capacity. Unlike static routing rules, which break quietly whenever a territory changes or a product is renamed, Wayfinder decides case by case and shows its reasoning, so revenue teams can audit a routing decision instead of guessing at one.
Call to action	Stop losing qualified demand between the form and the seller. Add Wayfinder to your Junction Cloud workspace.
Tagline Customer facing, under 10 words	Every lead, to the right seller, the first time.
Short message Customer facing, about 50 words	Wayfinder is an AI routing agent for inbound sales enquiries. It reads each enquiry, matches it to the right seller by territory, language and product expertise, and hands it off in seconds. Revenue teams can see why every lead landed where it did, so routing stops being a black box. 48 words
Medium message Customer facing, about 100 words	Wayfinder is an AI routing agent that decides where every inbound sales enquiry should go. It reads the enquiry itself rather than matching a form field, then assigns the lead by territory, language, product line and how much capacity a seller actually has this week. Every decision carries a written rationale, so revenue operations can audit routing instead of reverse engineering it. Rules based routing breaks quietly when a territory is redrawn or a product is renamed. Wayfinder adapts, and tells you when it is unsure rather than defaulting to a queue nobody watches. 96 words

Long message Customer facing, about 150 words	Most companies spend heavily to earn an inbound enquiry, then hand it to a routing table written years ago by someone who has left. Wayfinder replaces that table with an AI agent that reads each enquiry in context and assigns it to the seller best placed to win it, weighing territory, language, product expertise and current pipeline load. Because the agent reasons rather than pattern matches, it handles the cases rules never anticipated, a multinational buyer enquiring from the wrong country, a product renamed mid quarter, a partner referral that looks like a cold lead. Every assignment is logged with its reasoning, which means a routing dispute becomes a document instead of an argument. Wayfinder flags low confidence cases for a human rather than burying them in a default queue. Revenue teams keep the judgment. Wayfinder removes the wait. 142 words
Messaging pillars Customer facing. Each pillar leads with the benefit, then the proof.	1. Speed that shows up in pipeline. Enquiries route in seconds rather than sitting overnight in a queue. The buying window for inbound demand is measured in hours, and every hour of delay is a competitor's opening. 2. Routing you can audit. Every assignment carries a written rationale. When a seller asks why a lead went elsewhere, the answer is a record, not a reconstruction. 3. Rules that do not rot. Territory changes, product renames and reorganizations break static routing tables silently. Wayfinder reads intent, so a renamed product does not become a dead end. 4. Humans keep the judgment. Low confidence enquiries escalate to a person by design. The agent is built to say it is unsure, which is the behavior that earns a revenue team's trust.
Primary audience	Revenue operations leaders and marketing operations managers at companies selling in more than one country or more than one product line. They are measured on speed to first touch and on the share of qualified demand that converts. They are usually the only person who understands the current routing logic, and that is a problem they feel personally.
What they believe today	That routing is plumbing, unglamorous and mostly working. The insight to sell against is that they cannot prove it is working, because a lead that routes to the wrong seller does not fail loudly. It just closes slower, or not at all, and nobody attributes the loss to routing.
Competitive differentiation	Rules engines inside existing CRM platforms are free, familiar and already installed, which makes them the real competitor rather than any named vendor. The argument is not that rules are bad. It is that rules encode a snapshot of an organization that stopped being accurate the week after it was written. Wayfinder's difference is the written rationale on every decision, which is the thing a rules engine structurally cannot produce.

Proof points to develop	Median time from enquiry to seller acceptance, before and after. Share of enquiries reassigned by a human within seven days, which is the honest measure of routing accuracy. Percentage of enquiries the agent escalates rather than guessing. One named customer willing to describe a routing failure that predated the product, because the admission is what makes the rest credible.
Language we use	Routing agent. Assignment. Rationale. Escalate. Capacity. Speed to first touch. Plain verbs that a revenue operations manager already uses in their own status updates.
Language we avoid	Autonomous, since it implies the human is gone. Revolutionary and game changing, which signal that the writer had no specific claim to make. Seamless, which is what people say when integration is hard. Any number we cannot source in a footnote.

A note on how this document is built

The message ladder exists so that one argument survives compression. If the 150 word version and the tagline disagree, the positioning is not finished, it is just long. Writing the short version last is a common mistake, because it lets the long version hide a weak claim inside subordinate clauses. I write the tagline and the positioning statement first, then expand, and anything that will not survive the expansion was never load bearing.
